

# **TOWARDS A NEW FLOOD FORECASTING SYSTEM FOR THE LOWER MEKONG RIVER BASIN**

**Regional Flood Management and Mitigation Centre (Cambodia)  
SunWater (Australia); HKV Consultants (The Netherlands)**

# Introduction

## Introduction

### Data

### Models

### Example

### Future

### Conclusions

- RFMMC flood forecasting at present
  - Short term 1-5 day forecasts
  - 23 locations along Mekong River
  - SSARR model
  - Published at website
  - Distributed by email

# Introduction

## Introduction

Data

Models

Example

Future

Conclusions

- Road Map Mission of May 2006
  - identified need for more accurate medium to long term flood forecasts
- Improvements required:
  - Real time data (observations & communication)
  - Flood forecasting techniques
  - Access to results
  - Integration of available expertise
- New models are just one part of achieving the objective

# Data Requirements

Introduction

Data

Models

Example

Future

Conclusions

- Water level data
  - Near real time water level main stream
  - Near real time water level main tributaries
- Rainfall Data
  - WMO GTS rainfall data
  - Existing near real time rainfall data at agencies
  - Extension of network of near real time rainfall stations
- Satellite Rainfall Estimates
  - Satellite Rainfall Estimates
  - Satellite Rainfall Estimate Forecasts

Introduction

Example

Future

Conclusions

**Satellite  
Rainfall  
Estimate**

# Rain Gauge Network

Introduction

Data

Models

Example

Future

Conclusions

- Network Coverage
  - Average coverage good in Thailand and Viet Nam
  - Spatial distribution may need improvement
  - Both are insufficient in Cambodia and Lao PDR
- Operation and Maintenance
  - Thailand and Viet Nam need little support
  - Cambodia and Laos face problems
  - Historical stations need attention

# Analysis Cambodia

Introduction

Data

Models

Example

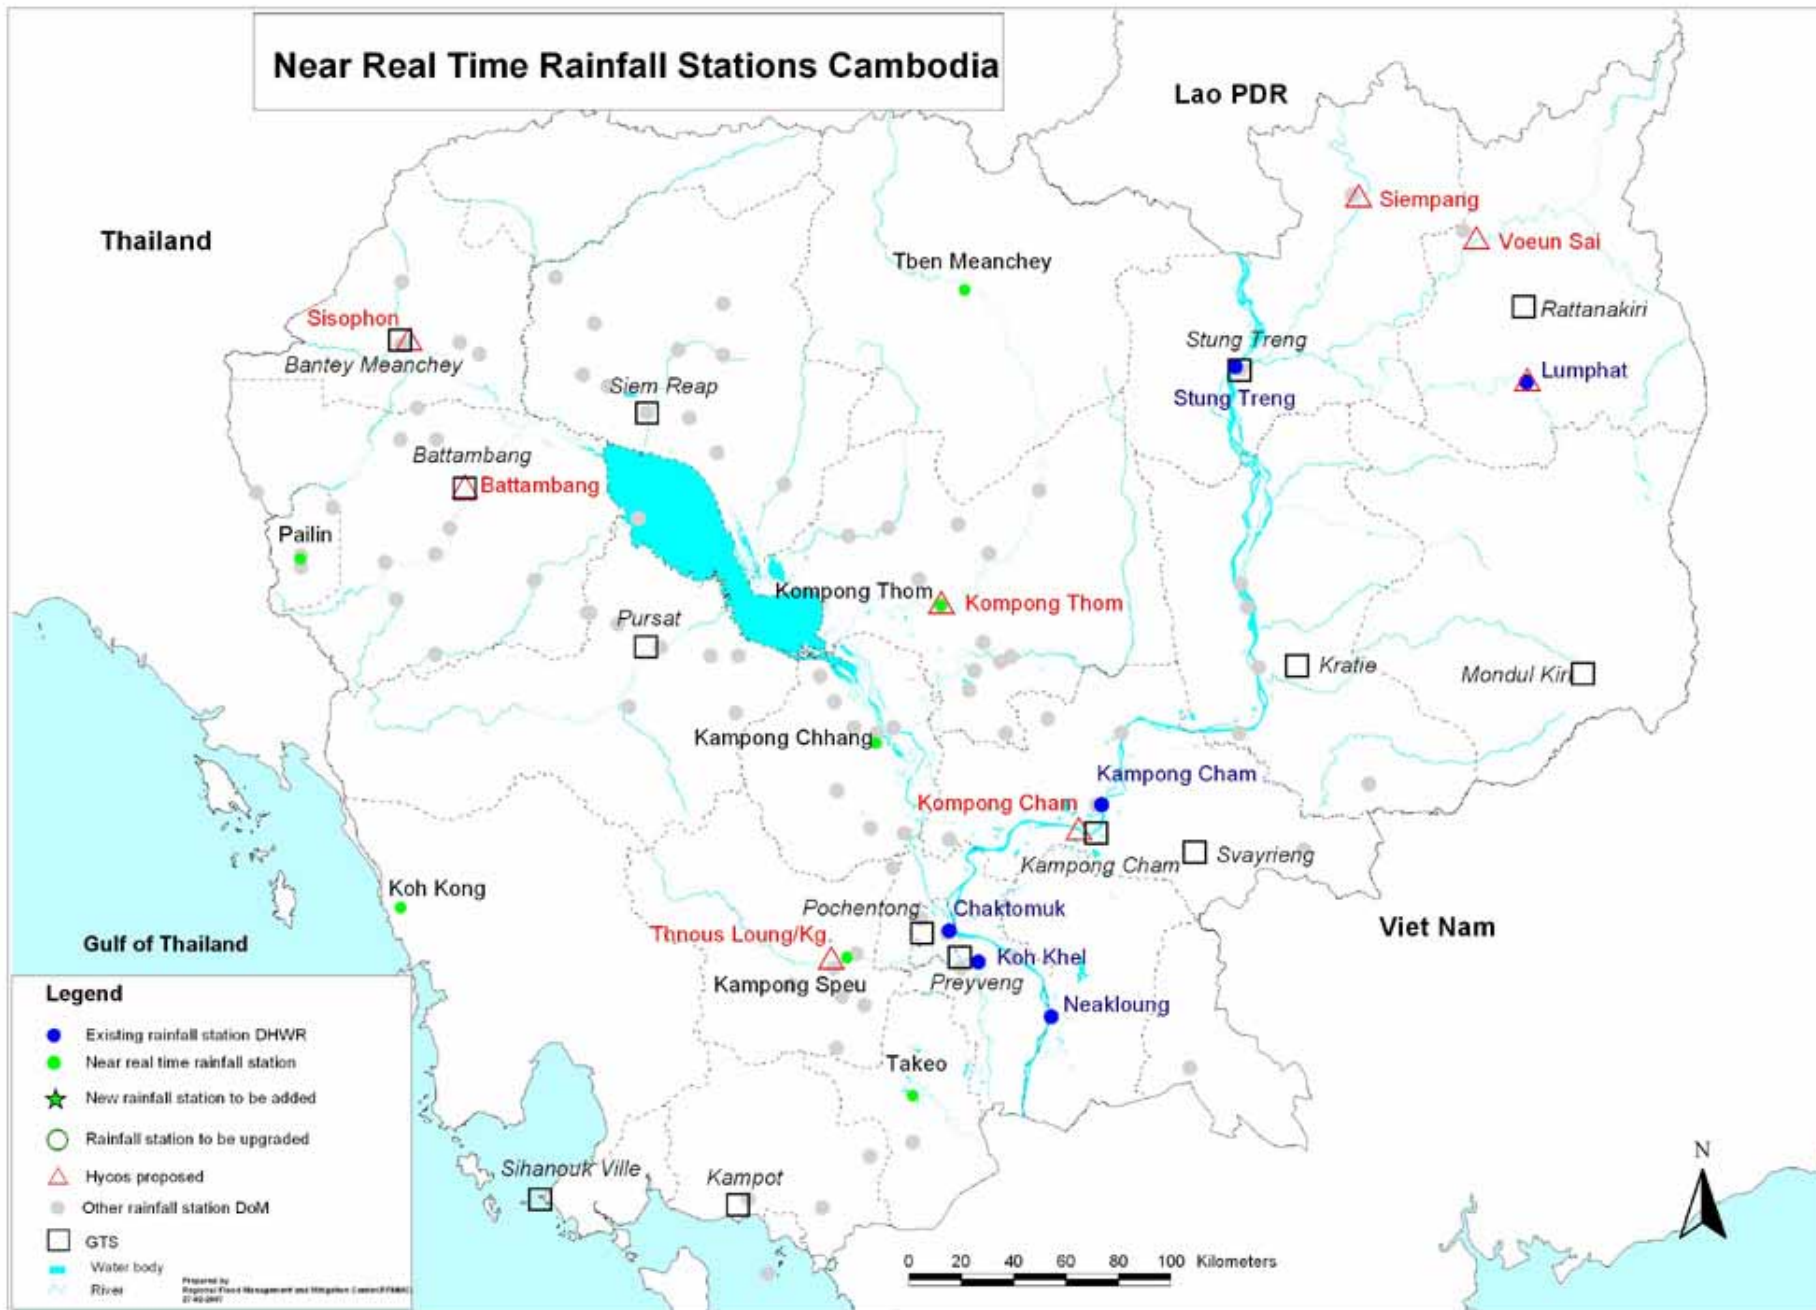

Future

Conclusions

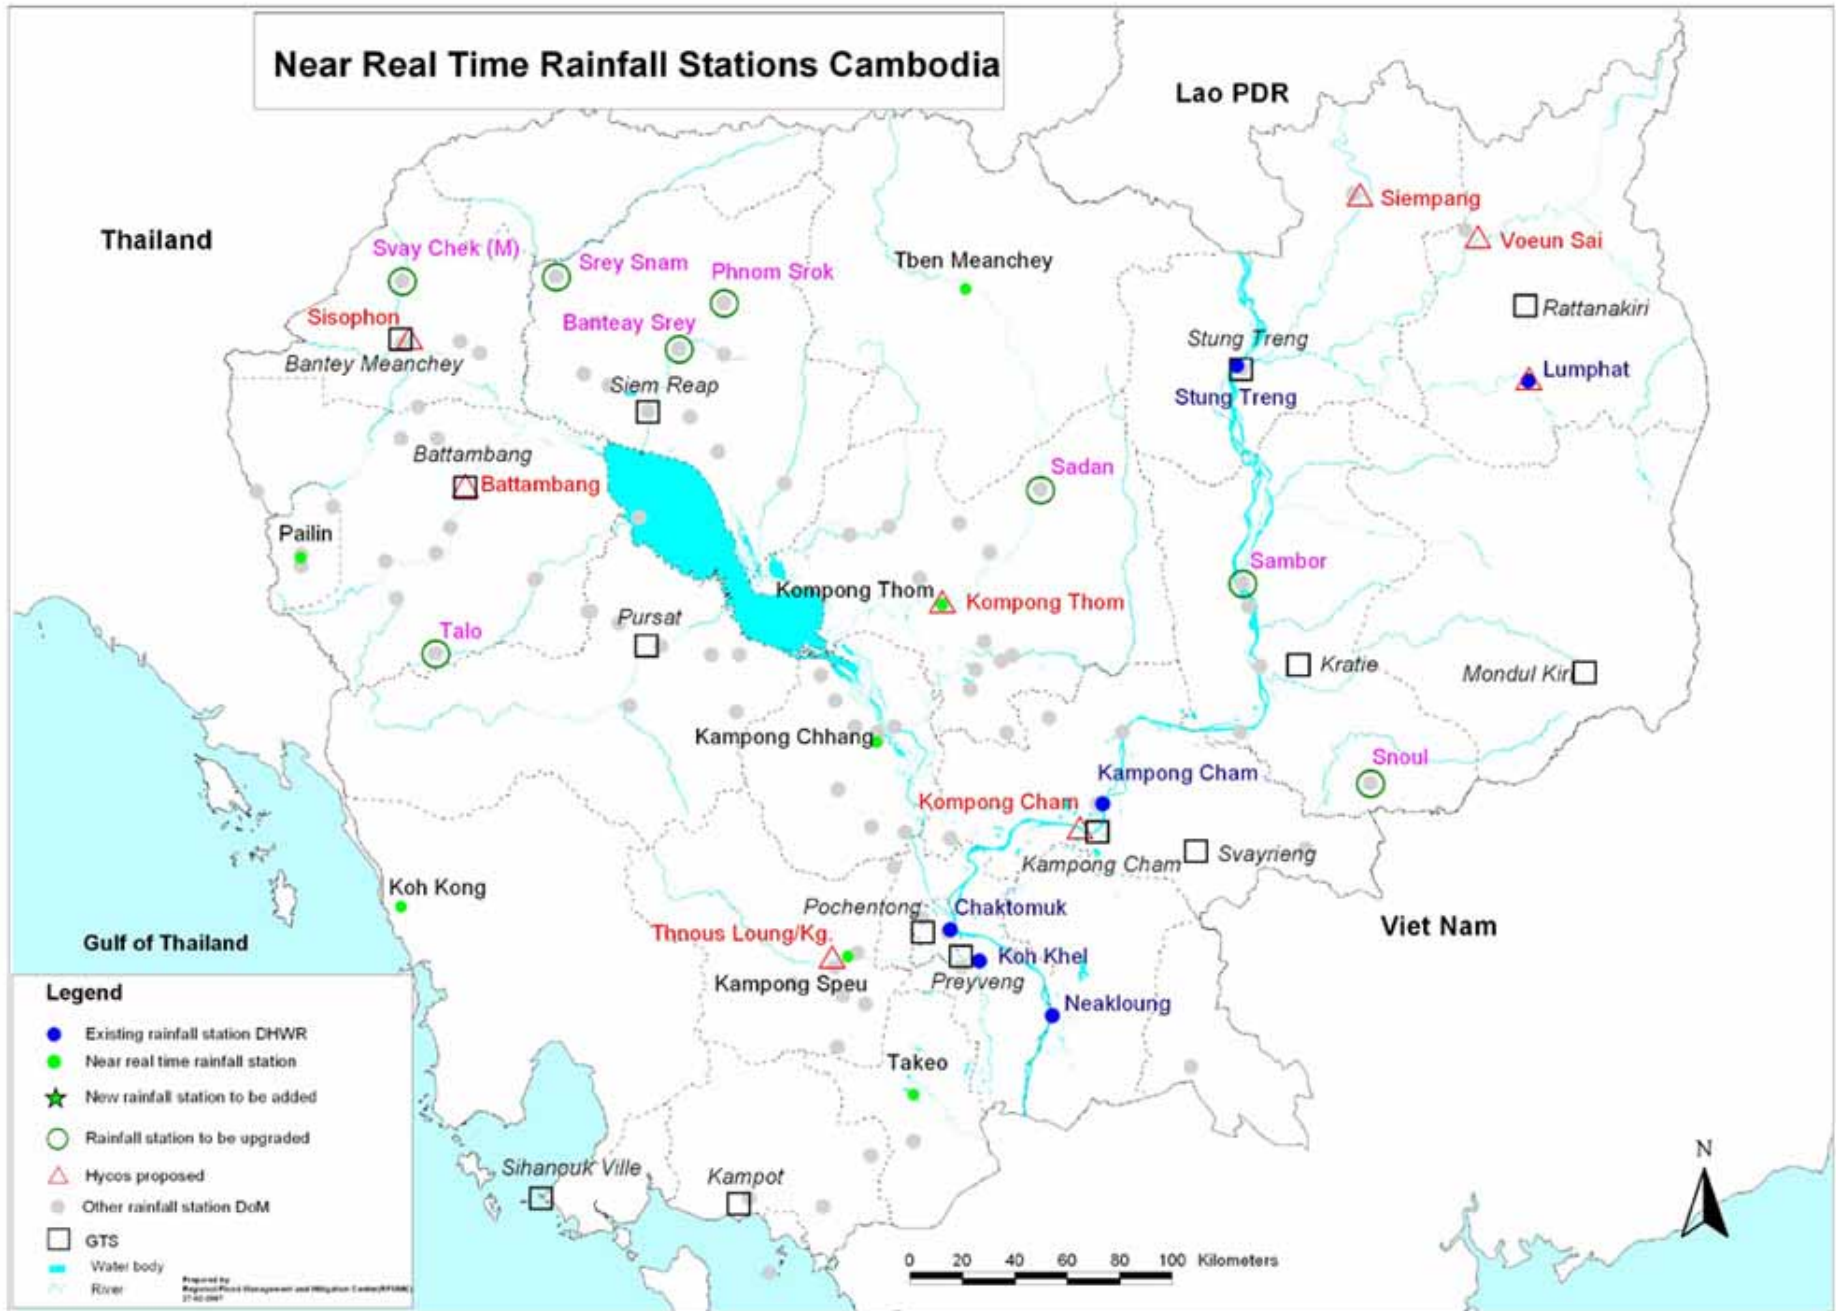

- Department of Hydrology and River Works, Ministry of Water Resources and Meteorology
  - Presently 5 rainfall stations reported
  - After upgrade 9
- Department of Meteorology (MOWRAM)
  - Presently 21 rainfall stations near real time
  - After upgrade 36
  - First phase (upgrade of 9 stations) started
  - Second phase (6 new stations) in November 2007
- M-HYCOS
  - 7 stations proposed

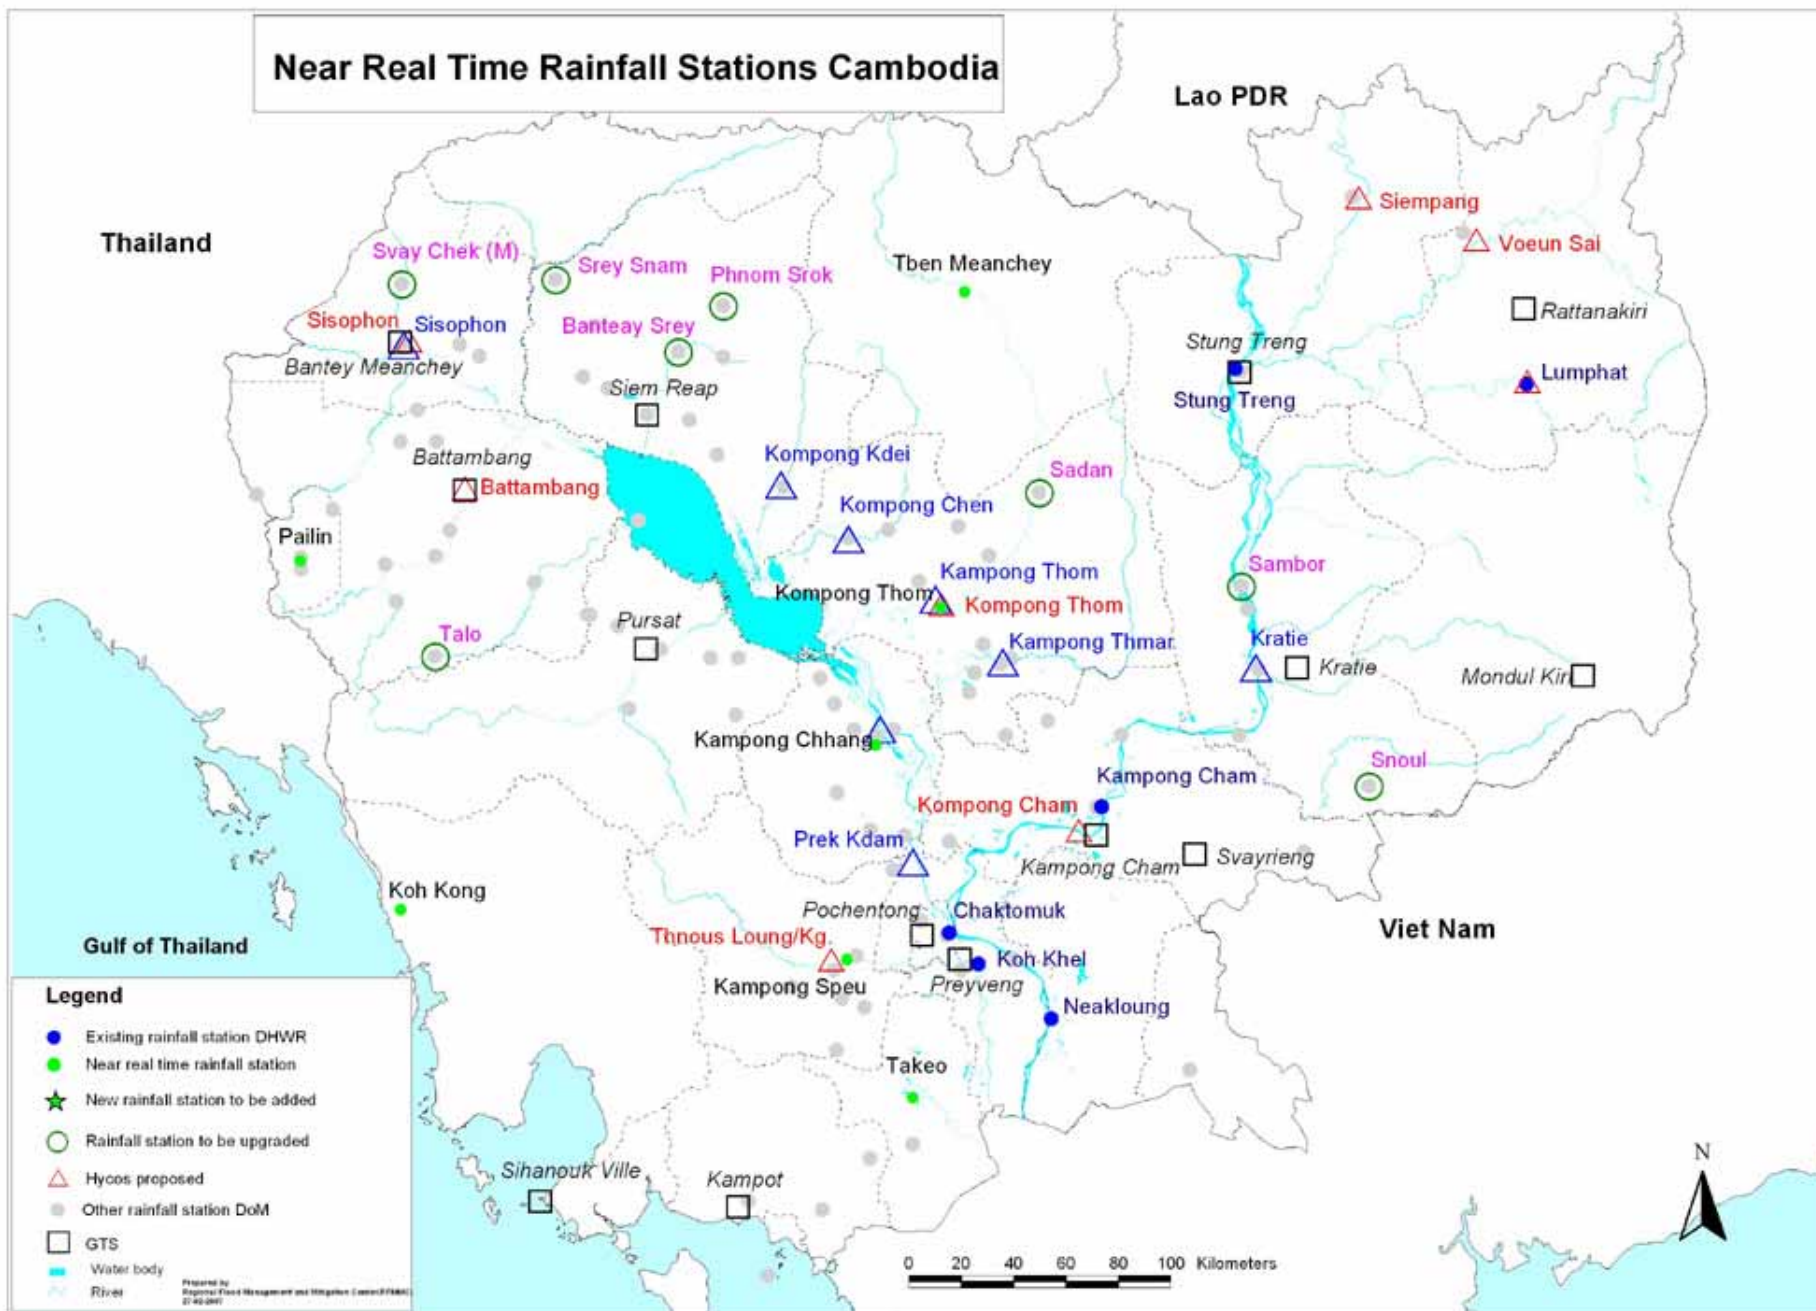

# Near Real Time Rainfall Stations Cambodia

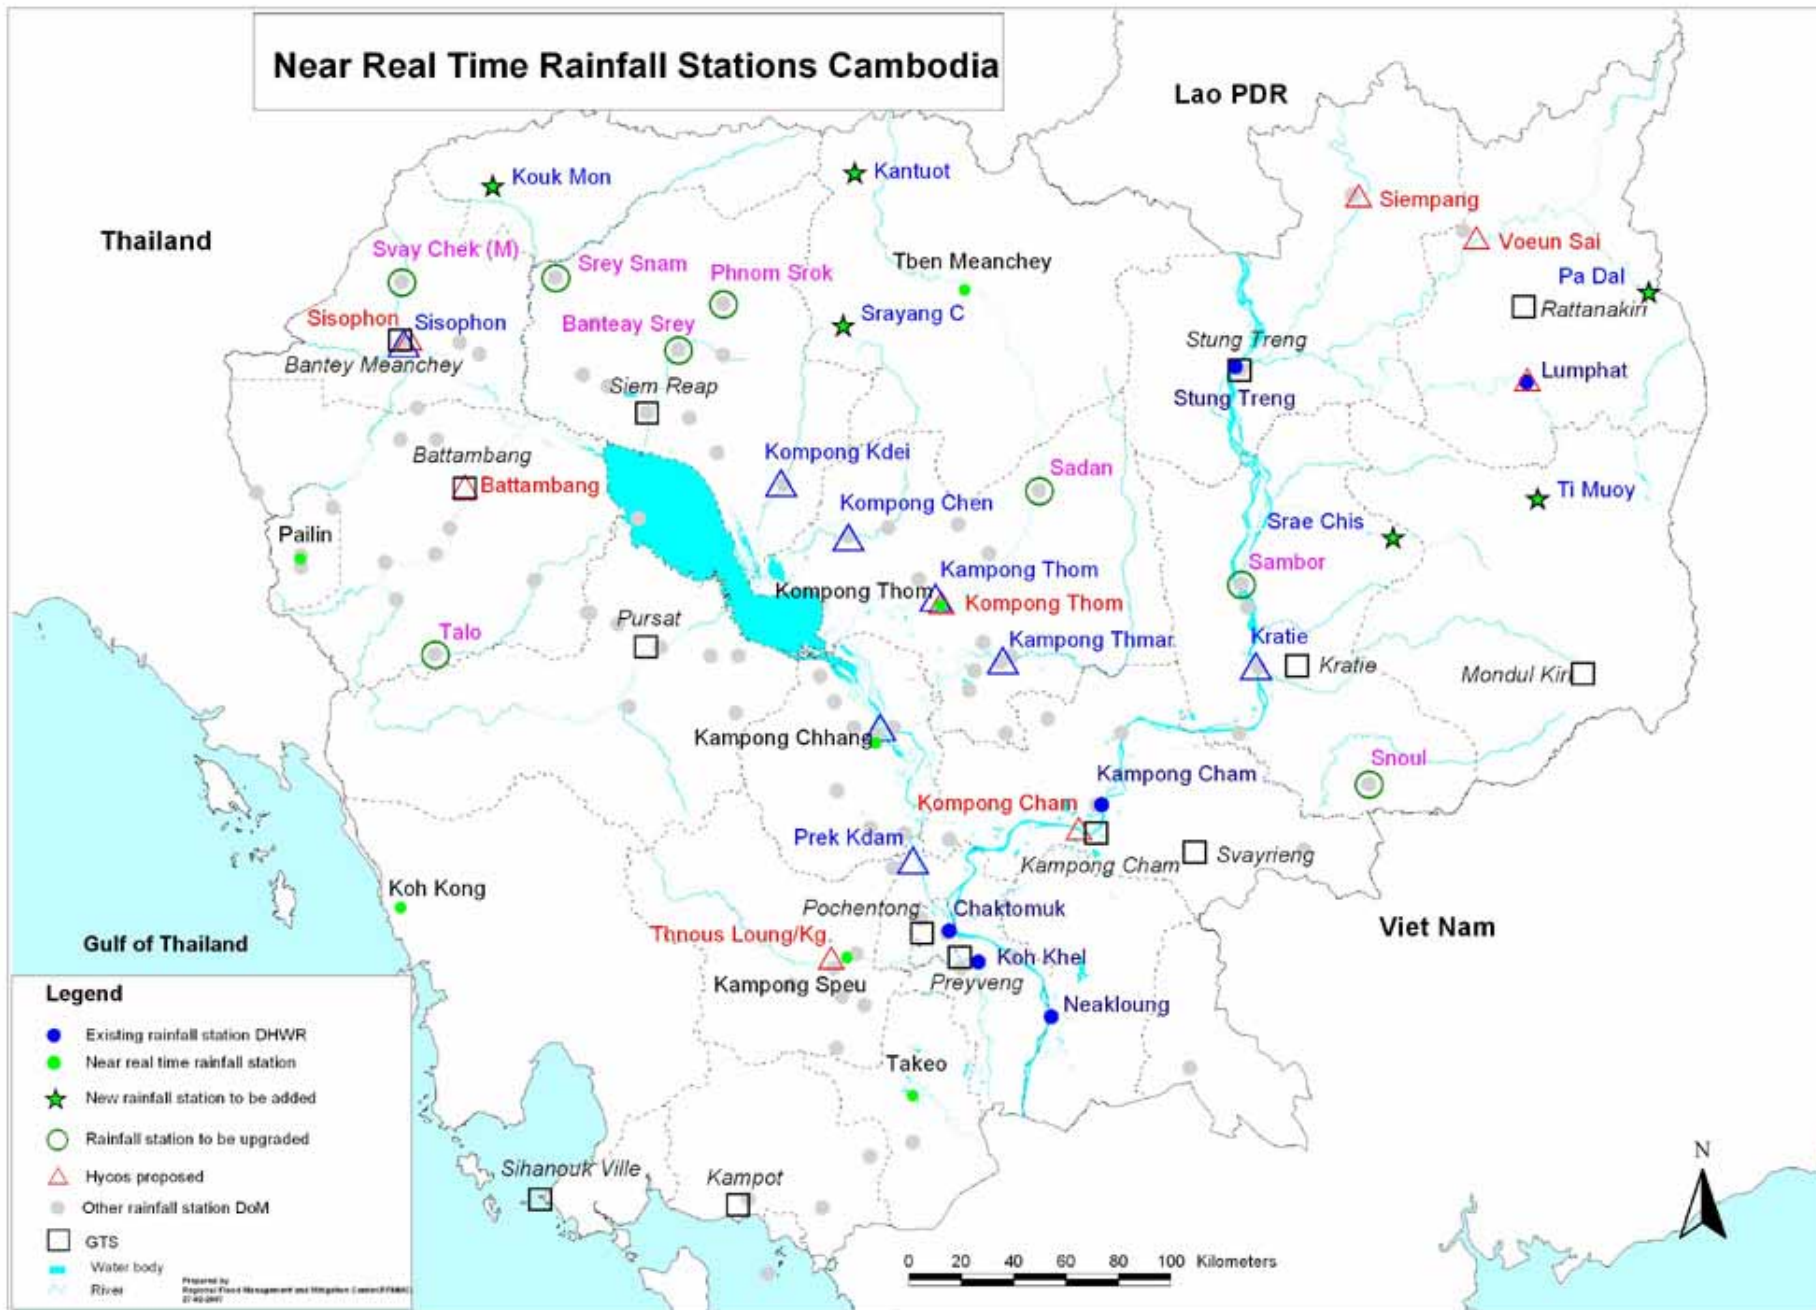

# Near Real Time Rainfall Stations Cambodia

# Near Real Time Rainfall Stations Cambodia

# Near Real Time Rainfall Stations Cambodia

# Analysis Lao PDR

Introduction

Data

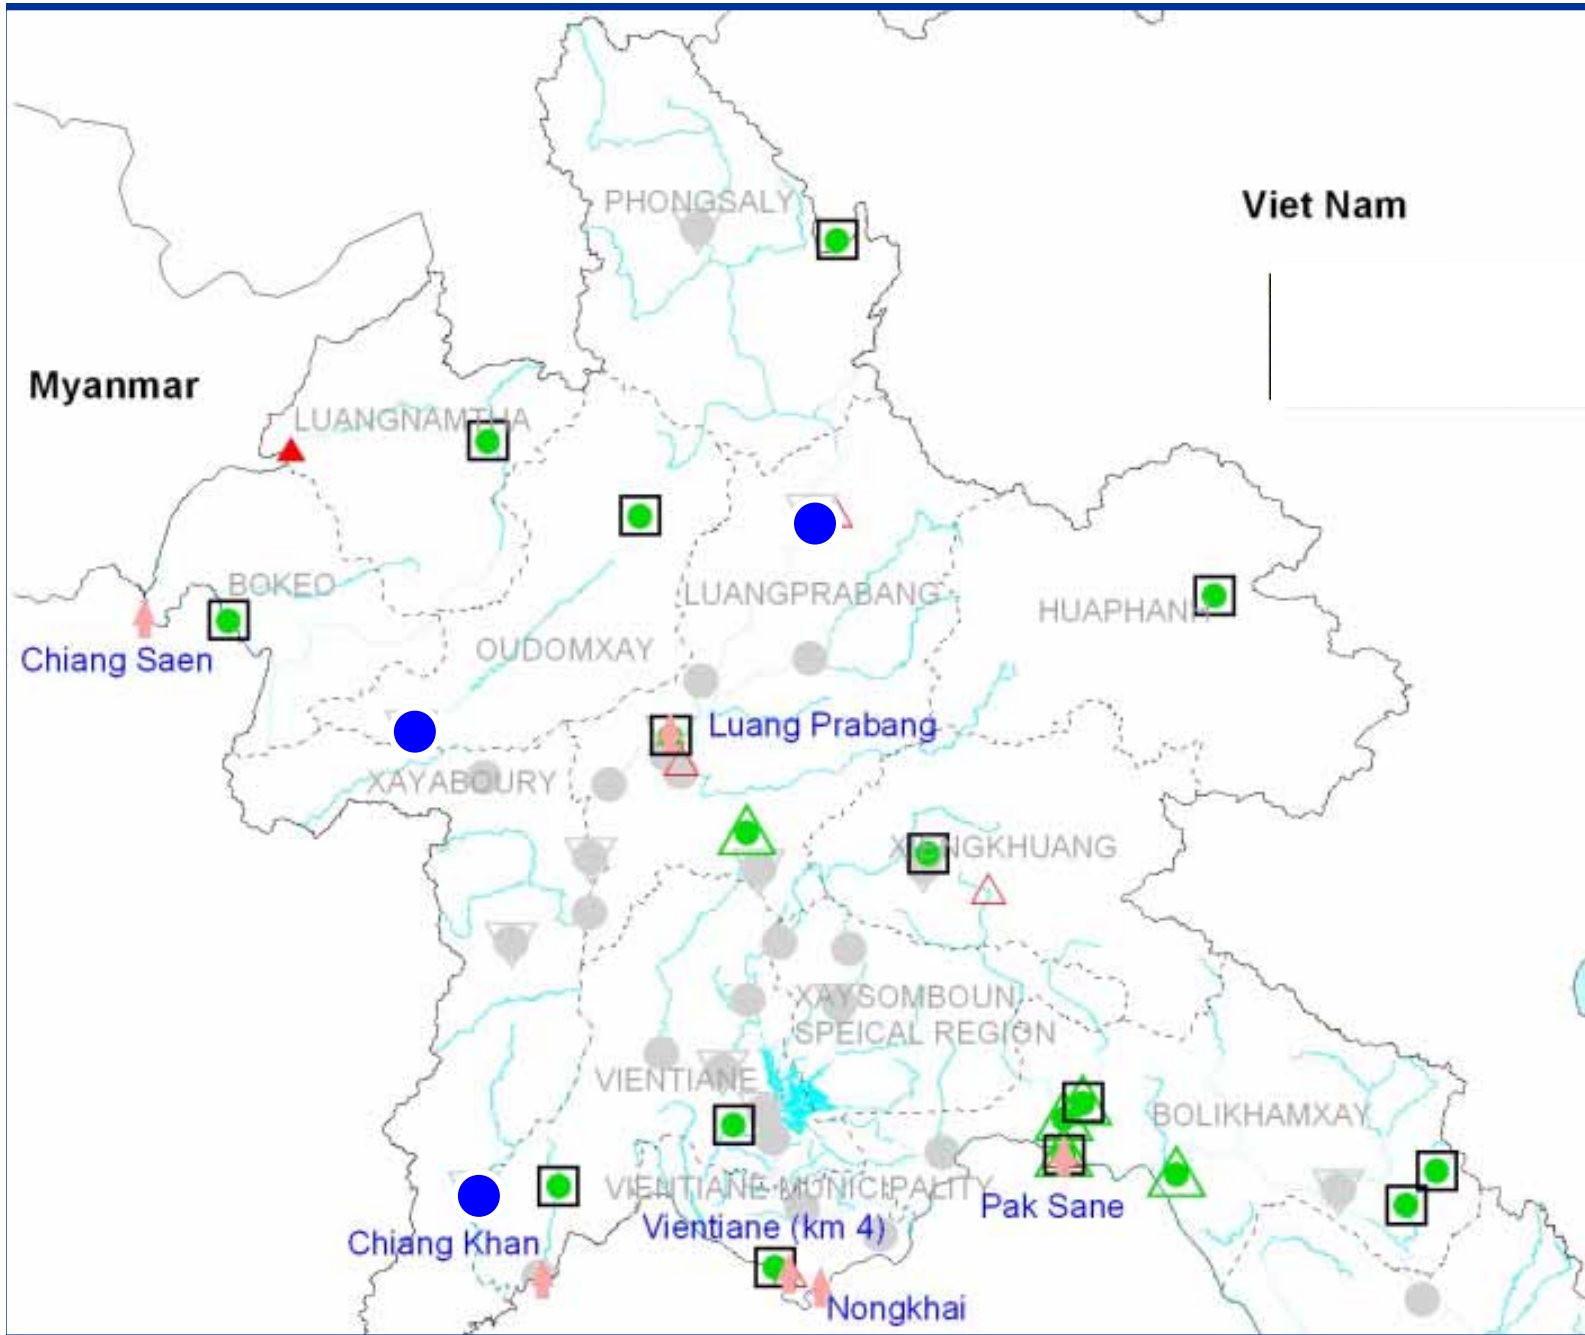

Models

Example

Future

Conclusions

- Waterways Administration Division, Department of Roads, Ministry of Communication, Transport, Post and Construction
  - Presently 8 rainfall stations reported
  - After upgrade 10-12
- Department of Meteorology and Hydrology, Ministry of Agriculture and Forestry
  - Presently 25 rainfall stations near real time
  - After upgrade 31-33
  - After extension network up to 40

# Models

Introduction

Data

Models

Example

Future

Conclusions

- Development of new system based on URBS
  - Conceptual hydrological flood routing
  - Parameter-poor
  - Robust operational
  - Input primarily rainfall data
- Advantages
  - Lack of data from one station or one data supplier permitted
  - Minimum set of rainfall data from WMO-GTS always available

# URBS

## Introduction

### Data

### Models

### Example

### Future

### Conclusions

- URBS is now used at the RFMMC
  - as trial model
  - to build expertise
- URBS has the following characteristics
  - Semi-distributed non-linear network model
  - Combines rainfall-runoff and runoff-routing
  - Ability to model spatial & temporal variability of rainfall
  - Proven record in large rivers

# URBS

Introduction

Data

Models

Example

Future

Conclusions

- Features of URBS include
  - Enhanced Data Management
  - Robust Performance
  - Forecast Rainfall
  - Linked Ratings
  - Reservoir Behavior
  - Adaptability

# CatchmentSIM

## Introduction

### Data

### Models

### Example

### Future

### Conclusions

- GIS topographic parameterisation & hydrologic analysis software
- Automatically delineates watersheds & sub-catchments
- Includes a flexible macro language to fully couple the output with any hydrologic model
- Uses publicly available digital elevation data from the NASA Shuttle Radar Topography Mission

# Se Bang Fai

Introduction

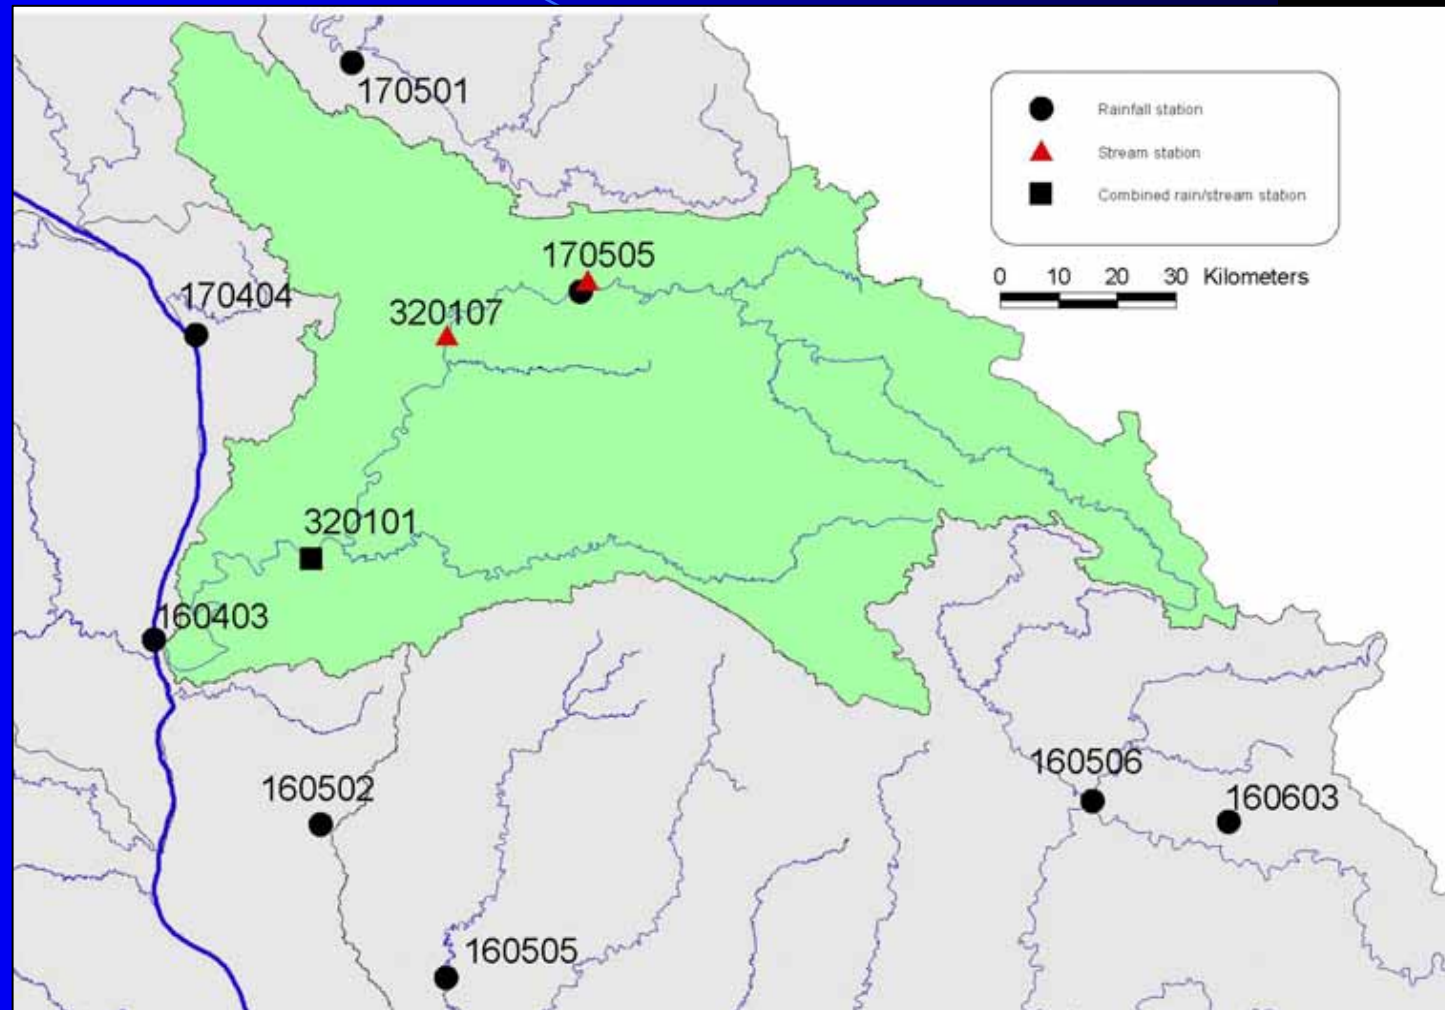

Data

Models

Example

Future

Conclusions

# Se Bang Fai

Introduction

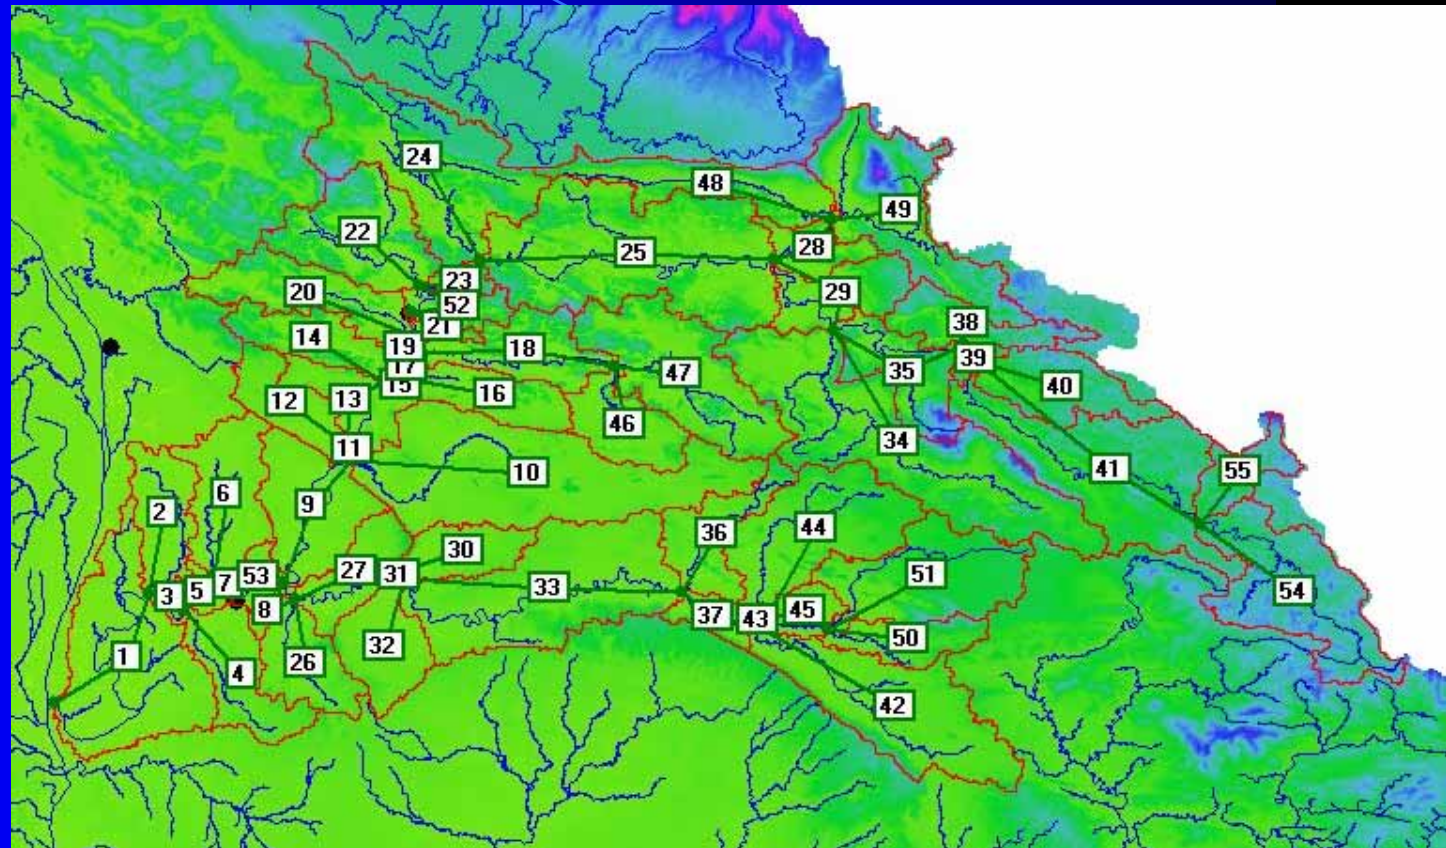

URBS

CatchmentSIM

Example

Directions

Conclusions

- Flow at any location
- Height at any location with a H-Q relationship

# Se Bang Fai

Data

Models

Example

Future

Conclusions

# Future Steps

Introduction

Data

Models

Example

Future

Conclusions

- 50 models to be developed
- Stage 1 upstream of Kratie
  - 40 models
- Stage 2 downstream of Kratie
  - 10 models
- Special module for Tonle Sap / Great Lake system
- Ultimately linked to hydrodynamic models

# Conclusions

Introduction

Data

Models

Example

Future

Conclusions

- Data
  - Upgrade existing historical rain gauge stations
  - Extend existing rain gauge station network
  - Use mobile phone – SMS
  - Use manual rain gauges
  - Low tech, low budget, low O&M
  - Complementary to AHNIP and M-HYCOS
  - Secure direct access to AHNIP and M-HYCOS
  - Secure GTS connection for RFMMC

# Conclusions

Introduction

Data

Models

Example

Future

Conclusions

- Models
  - URBS model selected as trial flood forecasting model
  - Basic and advanced training of staff completed
  - Example on Se Bangfai developed using CatchmentSIM shows the model has potential
  - Program to develop & calibrate 50 models almost completed (September 2007)
  - Overall Mekong model set up
  - Work on Cambodian floodplain and Great Lake system ongoing
  - Possible use during 2008 flood season if sufficient real time data is available

**Thank you very much for your  
attention !**
